SECTION A

Executive Summary

SUBSTATIONS SCORED

7,898

996 EHV · 6,902 HV

GRID LINES MAPPED

~12,400

~105,000 km coverage

MC SIMULATIONS

78.9 M

10,000 per substation

PUBLIC DATA SOURCES

30+

95 variables · zero proprietary

The SSI Index is the only operational framework that fuses substation-level engineering metrics with socio-economic consequence valuation in a single composite score — scoring 71/80 (89%) across 16 competitive dimensions, ahead of GMLC 1.1 (48/80), EPRI (40/80), and academic MCDA frameworks (41/80). Its engine processes 146,000+ source data points per run, executes 78.9 million Monte Carlo simulations through a 20×20 Gaussian copula correlation matrix, and performs 1.78 billion arithmetic operations — producing 469,404 output data points with full uncertainty quantification across 7,898 substations and ~12,400 grid lines spanning ~105,000 km.

Operated as a non-profit through a dedicated foundation, the SSI Index serves the public interest with zero dependency on proprietary data. All 95 variables are drawn from 30 verified public sources, making the methodology fully auditable and reproducible. Initially covering France's entire transmission and distribution grid, the Index is progressively being rolled out to all OECD countries — applying the same silo-breaking approach: fusing grid risk with societal exposure at asset-level resolution wherever open data permits.

R7 Digital Readiness: 1.000 → neutral

This month's spotlight — automatically selected for June 2026 — is **Poste Vosges 024** in Vosges, Grand Est. With an R_final of 0.346 (Medium band, 15th fleet percentile), its risk profile is dominated by the T (Transition) component at 1299% of its weight ceiling, followed by V (Voltage) at 702%. Modifiers collectively shift R_base by 9.4%, reflecting the substation's specific geographic, socio-economic, and network context.

SECTION B — RECURRING MODULE

Cyber & Economic Exposure Monitor

Why this section exists: Traditional grid risk frameworks treat cybersecurity and economic vulnerability as separate domains. The SSI's R7 (Digital Readiness) modifier and E (Economic) component allow us to cross these silos — revealing substations where low digital resilience intersects with high economic consequence. This is precisely the anticipatory intelligence that France Numérique / France 2030 digitalisation planning requires.

CYBER HIGH EXPOSURE

High/Critical + R7 < median

AVG R7 MODIFIER

1.0143

Range [0.99, 1.05]

HIGH-CONSEQUENCE SUBS

2,105

26.7% · R3 ≥ 1.13

B.1 Cyber-Physical Risk Matrix

Each substation plotted by R7 digital readiness (x-axis) vs overall R_median (y-axis). The upper-left quadrant — high risk, low digital readiness — identifies *blind spots* where grid stress is high but monitoring/response capacity is weakest.

● Low ● Medium ● High ● Critical Dashed lines = fleet medians

The cyber-physical matrix identifies **2166 blind-spot substations** — scoring High or Critical on overall risk while sitting below the fleet median for digital readiness ($R7 < 1.0015$). These substations are the most vulnerable to a compound event: a grid disturbance at a location where digital monitoring, automated switching, and remote diagnostic capacity are weakest. The blind spots concentrate in **Occitanie (621)**, **Nouvelle-Aquitaine (572)**, **Provence-Alpes-Côte d'Azur (402)**. Across the full fleet, 0 substations (0.0%) carry a HIGH cyber-exposure classification, while 0 (0.0%) are in the LOW tier.

B.2 Economic Impact by Business Fabric

Substations segmented by economic consequence tier — derived from the R3 consequence multiplier and E component. Higher R3 indicates the substation serves a territory with greater socio-economic exposure to disruption.

Commercial / Mixed

Est. VoLL: €3–8/kWh

911 substations (11.5%) High/Critical: 512 (56.2%) Avg R: 0.503 Avg E: 0.400 / 0.10

Light-Rural / Agricultural

Est. VoLL: €1–3/kWh

4,424 substations (56.0%) High/Critical: 2206 (49.9%) Avg R: 0.508 Avg E: 0.197 / 0.10

Value of Lost Load (VoLL) context: ACER's 2023 estimate places average VoLL at €13.1/kWh for industrial customers and €3.2/kWh for residential. The SSI's R3 consequence multiplier allows us to identify which substations serve the most economically exposed territories. **942 substations** combine capital-intensive economic fabric ($R3 \geq 1.14$) with High or Critical risk classification — representing the highest VoLL-weighted exposure in the fleet.

The capital-intensive tier concentrates in **Île-de-France (542)**, **Auvergne-Rhône-Alpes (278)**, **Hauts-de-France (216)** — regions where industrial corridors depend on uninterrupted power for continuous processes. A single hour of unplanned outage at these substations carries an estimated VoLL of €15–30/kWh, compared to €1–3/kWh in rural agricultural areas. The fleet-wide average energy poverty rate is 7.0%, but this masks sharp regional variation: Southern regions combine higher energy poverty with higher grid risk, creating a double vulnerability that the E component captures. This cross-referencing of economic fabric with grid condition is unique to the SSI — no competing framework links VoLL exposure to substation-level risk scores.

B.3 Département Digital Readiness Ranking

Départements ranked by average R7 modifier — lower values indicate weaker digital infrastructure (DESI sub-dimensions). Cross-referenced with average R_{median} to identify départements combining digital exposure with high grid stress.

R7 Digital Readiness
Low High

WORST DIGITAL READINESS — TOP 15 REGION REGIONS

Longer bar = higher R7 = better digital infrastructure.

1	Haute-Corse Δ high R		0.9894
2	Corse-du-Sud Δ high R		0.9913
3	Loir-et-Cher		0.9991
4	Indre		0.9993
5	Oise		0.9994
6	Alpes-de-Haute-Provence Δ high R		0.9994
7	Nord		0.9995
8	Finistère Δ high R		0.9995
9	Vaucluse Δ high R		0.9996
10	Bas-Rhin		0.9996
11	Dordogne Δ high R		0.9996
12	Haute-Garonne Δ high R		0.9996

13	Bouches-du-Rhône	▲ high R		0.9996
14	Vosges			0.9996
15	Deux-Sèvres	▲ high R		0.9996

region-level analysis reveals a clear digital divide mirroring the broader DESI pattern. **Haute-Corse** has the lowest average R7 (0.9894), while **Isère** leads at 1.0507 — a spread of 0.0613 across the R7 range. **40 region regions** combine below-median digital readiness with above-median grid risk, making them priority targets for digitalisation investment. The R7 modifier is intentionally narrow to reflect the current limitations of open DESI data — as NIS2 compliance reporting matures, future editions will expand R7's dynamic range and incorporate operational technology (OT) security indicators.

B.4 Monthly Pulse

Inaugural edition — Baseline Snapshot (June 2026). This edition establishes the baseline for the Cyber & Economic Exposure Monitor. Key reference points: fleet average R7 = 1.0143, median = 1.0015; 0 substations classified HIGH cyber-exposure; 2166 blind-spot substations (High/Critical risk + below-median R7); 17 Critical-band substations with below-median digital readiness. Future editions will track deltas against this baseline.

SECTION C

Data Refresh & Changelog

The SSI v4.0.2 draws on **35 verified public data sources** feeding 95 variables across 6 components and 5 modifiers. This section provides a live registry of all sources, their update frequencies, and the current state of the fleet. Transparency in data vintage is central to the SSI's credibility.

BAND DISTRIBUTION

No primary data sources have been updated since the v4.0.2 launch baseline. All **7,898 substation scores remain unchanged** this edition. The fleet median R of 0.502 (mean 0.495) reflects a distribution skewed toward the lower bands, with 5.0% in Low and 44.1% in Medium. The first material score changes are expected when the national regulator publishes the annual quality-of-supply indicators and when DER registries refresh. High-frequency sources (OSM, weather) update weekly but feed only infrastructure topology (R4) and thermal proxy (I5), which have minimal impact on fleet-level score distribution.

C.3 Changelog — v3.4 → v4.0.2

SECTION D — MONTHLY DEEP-DIVE

The Rhône Valley Corridor: Where Nuclear Reliance Meets Energy Transition Pressure

Deep-dive rotation: Each edition features a substantive thematic analysis. The 12-month rotation: **Ed. 001** Rhône Valley corridor · **002** DER saturation hotspots (Occitanie/PACA) · **003** Climate vulnerability under CMIP6 · **004** Metropolitan–Rural economic impact disparity · **005** Nuclear fleet dependency and transition risk · **006** Infrastructure age vs Linky rollout · **007** Stress–Resilience quadrant trends · **008** T-component forward projections · **009** Département Grid Health Cards · **010** Academic validation and peer feedback · **011** European replication feasibility · **012** Year in review.

D.1 Why the Rhône Valley, Why Now

The Provence–Alpes–Côte d’Azur hosts **562 substations** across 6 region regions, making it the locus of this edition’s deep-dive analysis. Its risk profile is concentrated in the upper bands: **559 substations (99.5%)** are classified High and 3 Critical, with only 0 in the Low band. 100% of corridor substations score above the national fleet median of 0.502. The corridor median R of 0.637 reflects the local risk profile. The corridor concentrates the country’s industrial heartland. The SSI flags continuity-of-supply deficits, infrastructure age mismatches with modern demand patterns, and grid modernization lag under national digitalisation timelines.

D.2 Corridor Map and Scoring

D.3 Component Analysis

COMPONENT AVERAGES — PROVENCE-ALPES-CÔTE D'AZUR VS FLEET			MODIFIER AVERAGES — PROVENCE-ALPES-CÔTE D'AZUR VS FLEET		
C — Continuity	0.608 vs 0.497 (+22%)		R3 Consequence	1.106	fleet 1.091 ↑
I — Infrastructure	0.595 vs 0.460 (+29%)		R4 Graph Crit.	1.011	fleet 1.006 ↑
S — Saturation	0.356 vs 0.276 (+29%)		R6a Restoration	1.010	fleet 0.992 ↑
V — Voltage	0.694 vs 0.671 (+3%)		R6b Seismic	1.056	fleet 1.023 ↑
E — Economic	0.389 vs 0.341 (+14%)		R7 Digital Read.	1.000	fleet 1.014 →
T — Transition	0.610 vs 0.568 (+7%)				

The dominant risk driver across the Provence-Alpes-Côte d'Azur corridor is **T (Transition)**, averaging 0.610 against a fleet average of 0.568 — occupying 1220% of its weight ceiling (w = 0.05). The second contributor is **V (Voltage)** at 0.694 vs fleet 0.671 (694% of ceiling). Among modifiers, the R3 consequence multiplier averages 1.106 (fleet: 1.091), reflecting the socio-economic exposure of the corridor. The R6b seismic modifier averages 1.056, capturing the local seismic exposure — a dimension invisible to every competing framework.

D.4 Département Breakdown

REGION RISK PROFILE — SORTED BY MEAN R

Longer bar = lower R = better resilience.

The region regions-level breakdown reveals significant intra-regional variation. **Alpes-de-Haute-Provence** leads with a mean R of 0.701 across 87 substations, while **Alpes-Maritimes** scores 0.580 — a spread of 0.121 within a single corridor. The SSI's substation-level granularity reveals that the Provence-Alpes-Côte d'Azur is not uniformly stressed but contains distinct sub-corridors of concentrated risk — precisely the kind of spatial pattern that investment planning requires.

D.5 Implications

248 Provence-Alpes-Côte d'Azur substations score $R \geq 0.650$, placing them in the upper quartile of national risk. For NEPN / national digital plan / RRP investment prioritisation, this analysis identifies the Alpes-de-Haute-Provence sub-corridor as the highest-priority target — where DER deployment is accelerating against ageing infrastructure with above-average continuity deficits and significant socio-economic exposure. The SSI's silo-breaking approach reveals what no single-discipline framework can: that these substations matter not only because of their engineering condition, but because the communities they serve are disproportionately vulnerable to disruption. This is precisely the anticipatory grid planning capability that the SSI was built to provide.

SECTION E — RECURRING MODULE

European Context Card

How this works: Each edition includes one European Context Card drawn from the §16 Peer Benchmarking framework. The card is selected to complement the month's deep-dive theme. This month: **SAIDI comparison** — because the Rhône Valley corridor analysis hinges on France's continuity performance relative to European peers. Future editions rotate through: VoLL comparison (Ed. 002), DER saturation vs Germany (003), CMIP6 climate hazard vs Nordic peers (004), etc. The underlying data updates annually with the CEER Benchmarking Report release.

Unplanned SAIDI (min/customer/year) — Selected Countries

Longer bar = lower SAIDI = better reliability. Values in min/customer/year.

Source: CEER 7th Benchmarking Report (2022); CRE TIQE (2023); Bundesnetzagentur (2024). France sub-categories from CRE territory classification (urban/rural). · See §16 Peer Benchmarking for full methodology and caveats. · Updated annually with CEER BR release.

This month's key insight: The Provence-Alpes-Côte d'Azur corridor deep-dive shows **562 substations** (of 562) with C-component above 70% of its weight ceiling — indicating continuity-of-supply performance consistent with rural territory classification. The corridor's average C of 0.608 is **1.2× the fleet average** of 0.497. The SSI reveals what aggregate national statistics conceal: that the country's mid-tier European position is not a uniform condition but a statistical average of urban-quality performance and rural-tier performance — and the corridor concentrates the worst of the latter.

Regional Risk Ranking — All 13 French Régions

Where does the Rhône Valley sit within the national landscape? Regions sorted by mean R_{median}, with band distribution and fleet comparison.

Longer bar = lower R = better resilience. Sorted worst → best.

The Provence-Alpes-Côte d'Azur ranks **#1 of 13 region regions** by mean R_{median} , placing it among the upper tier of national risk. The three most stressed are Provence-Alpes-Côte d'Azur, Corse, Occitanie, while the three most resilient are Île-de-France, Bourgogne-Franche-Comté, Grand Est. 8 of 13 score above the fleet average of 0.495. This ranking — possible only because the SSI scores every substation individually rather than relying on aggregate DSO or national statistics — reveals the true spatial distribution of grid stress. It is precisely this substation-level granularity that positions the SSI as a tool for investment prioritisation: not treating entire regions as monoliths, but identifying the specific corridors within each that demand attention.

SECTION F — RECURRING MODULE

SSI Enhanced Neural Network — Monthly Topic

From grid intelligence to BESS valuation platform. The SSI Index answers *"How healthy is this substation?"* The SSI Enhanced Neural Network (SSI-ENN) extends this into: *"What is a BESS worth at this substation — to the Enedis/RTE and to the community?"* Each edition of this report explores one building block of the SSI-ENN's five-layer architecture, showing how the SSI Index data feeds directly into investment-grade grid analytics.

LAYER 3 §0.5.6 · June 2026

Explainability & SHAP Values

Clients need to understand not just the prediction but WHY a substation ranks highly

Investment-grade models require interpretability. SHAP (SHapley Additive exPlanations) provides a rigorous, game-theoretic attribution of each feature's contribution to each prediction. For every substation, the SSI-ENN produces a SHAP waterfall: starting from the fleet-average valuation and showing how each feature pushes the estimate up or down. This

directly connects to the SSI Index: if SHAP identifies C (Continuity) as the dominant positive driver, the client knows the BESS value depends primarily on the substation's poor reliability history. Transparency converts model outputs into investment decisions.

KEY CONCEPTS

→ SHAP: game-theoretic feature attribution per prediction

→ Waterfall: fleet average → substation prediction

→ Direct traceability to SSI components and data sources

→ Feature importance validated against domain expertise

LIVE SSI DATA CONNECTION

The training set comprises 7,898 substations with complete feature vectors. Average CI_width of 0.188 across the fleet provides the uncertainty ground truth that the neural network's quantile regression heads must calibrate against. The fleet's risk distribution — 397 Low, 3481 Medium, 3941 High, 79 Critical — ensures balanced training across all risk bands.

Coming next month:

LAYER 3

 Uncertainty Quantification — *Investment-grade predictions require calibrated confidence intervals, not just point estimates*

SECTION G

Looking Ahead

NEXT MONTH — EDITION 02

Mountain Region

Deep-dive into Region 10's grid risk profile — substation map, component analysis, region regions breakdown. European Context Card: Light-rural tier — limited substation density.

NEXT DATA REFRESH

Q3 2026 — 2 Quarterly Sources

SDES, Bpifrance are due for refresh in Q3. Impact: DER registry (T1), business fabric indicators (E2), macro-economic data. Highest-impact annual source pending: CRE (Commission de Régulation de l'Énergie) (8 variables → C1-C4 (SAIDI/SAIFI), I1-I3 (IRI), quality regulation).

FLEET SPOTLIGHT

Drôme: Highest Risk Concentration

Drôme has the highest concentration of High/Critical substations: 95 of 95 (100%) are in the upper risk bands — avg R = 0.756. This makes it the most acute risk corridor in the fleet.

Edition O2 will be published on the second Thursday of July 2026. Deep-dive region: **Region 10**. To ensure you receive it, confirm your subscription segment (General / Institutional / Academic) by email to ssi_index@ikenga.eu.

Feedback welcome. The SSI Index is designed to evolve through stakeholder dialogue. If you represent a French utility, CRE, RTE, Enedis, municipal energy company, or academic institution and would like to contribute data or methodology feedback, please contact us at ssi_index@ikenga.eu. The SSI's credibility depends on open scrutiny.
