SECTION A

Executive Summary

SUBSTATIONS SCORED

6,495

Major + distribution across Statnett SF

GRID LINES MAPPED

~18,500

~22,000 km transmission & distribution

MC SIMULATIONS

~38.7 M

10,000 per substation

PUBLIC DATA SOURCES

30+

95 variables · zero proprietary

The SSI Index is the only operational framework that fuses substation-level engineering metrics with socio-economic consequence valuation in a single composite score — scoring 71/80 (89%) across 16 competitive dimensions. Its engine processes ~52,000 source data points per run, executes ~38.7 million Monte Carlo simulations through a 20×20 Gaussian copula correlation matrix, and performs ~400 million arithmetic operations — producing ~232,000 output data points with full uncertainty quantification across 6,495 substations and ~18,500 grid lines spanning ~22,000 km.

Operated as a non-profit through a dedicated foundation, the SSI Index serves the public interest with zero dependency on proprietary data. All 95 variables are drawn from 30+ verified public sources (NVE/RME, Statnett SF, Gassco, MET Norway, SSB (Statistisk sentralbyrå), NGU, VINNOVA), making the methodology fully auditable and reproducible. Initially covering Norway’s Statnett SF-managed transmission and ~80 distribution network operators (DNOs), the Index is progressively being rolled out to all OECD countries — applying the same silo-breaking approach: fusing grid risk with societal exposure at asset-level resolution wherever open data permits.

FLEET PERCENTILE

COMPONENTS

C Continuity: 0.290 / 0.30 (97%)

I Infrastructure: 0.463 / 0.25 (185%)

S Saturation: 0.100 / 0.20 (50%)

V Voltage: 0.329 / 0.10 (329%)

E Economic: 0.392 / 0.10 (392%)

T Transition: 0.241 / 0.05 (482%)

MODIFIERS

R3 Consequence: 1.050 ↑ amplifies

R4 Graph Criticality: 1.007 → neutral

R6a Restoration: 0.980 ↓ dampens

R6b Seismic: 1.101 ↑ amplifies

R7 Digital Readiness: 0.984 ↓ dampens

This month's spotlight — automatically selected for June 2026 — is **Sub-1072125079** in Troms, Troms. With an R_final of 0.332 (Medium band, 70th fleet percentile), its risk profile is dominated by the T (Transition) component at 482% of its weight ceiling, followed by E (Economic) at 392%. Modifiers collectively shift R_base by 7.98%, reflecting the substation's specific geographic, socio-economic, and network context.

SECTION B — RECURRING MODULE

Cyber & Economic Exposure Monitor

Why this section exists: Traditional grid risk frameworks treat cybersecurity and economic vulnerability as separate domains. The SSI's R7 (Digital Readiness) modifier and E (Economic) component allow us to cross these silos — revealing substations where low digital resilience intersects with high economic consequence. This is precisely the anticipatory intelligence that Norway's Energy Regulatory Office (NVE/RME) and network operator strategic planning requires.

CYBER HIGH EXPOSURE

AVG R7 MODIFIER

0.9668

Range [0.99, 1.05]

HIGH-CONSEQUENCE SUBS

1,630

B.1 Cyber-Physical Risk Matrix

Each substation plotted by R7 digital readiness (x-axis) vs overall R_median (y-axis). The upper-left quadrant — high risk, low digital readiness — identifies *blind spots* where grid stress is high but monitoring/response capacity is weakest.

● Low ● Medium ● High ● Critical

Dashed lines = fleet medians

The cyber-physical matrix identifies **4 blind-spot substations** — scoring High or Critical on overall risk while sitting below the fleet median for digital readiness ($R7 < 0.9661$). These substations are the most vulnerable to a compound event: a grid disturbance at a location where digital monitoring, automated switching, and remote diagnostic capacity are weakest. The blind spots concentrate in **Finnmark (3)**, **Innlandet (1)**. Across the full fleet, 0 substations (0.0%) carry a HIGH cyber-exposure classification, while 0 (0.0%) are in the LOW tier.

B.2 Economic Impact by Industrial Sector

Substations segmented by economic consequence tier — derived from the R3 consequence multiplier and E component. Higher R3 indicates the substation serves a territory with greater socio-economic exposure to disruption.

Capital-Intensive / High-Consequence

Est. VoLL: NOK130–260/kWh (NOK)

Capital nodes — highest economic loss per interruption (semiconductor fabs, data centers, refineries, hospitals)

1,630 substations (25.1%) High/Critical: **4** (0.2%) Avg R: **0.329** Avg E: **0.294** / 0.10

Industrial / Medium–Large Enterprise

Est. VoLL: NOK65–130/kWh (NOK)

Industrial belt — significant continuity requirements (manufacturing, logistics hubs)

1,630 substations (25.1%) High/Critical: **1** (0.1%) Avg R: **0.318** Avg E: **0.293** / 0.10

Commercial / SME–Dense

Est. VoLL: NOK25–65/kWh (NOK)

Service economy + retail — moderate individual impact (commercial districts, mixed-use)

1,603 substations (24.7%) High/Critical: **0** (0.0%) Avg R: **0.303** Avg E: **0.292** / 0.10

Light / Agricultural / Rural

Est. VoLL: NOK8–25/kWh (NOK)

Sparse activity, agricultural land — lower VoLL (residential, agricultural)

1,632 substations (25.1%) High/Critical: **0** (0.0%) Avg R: **0.290** Avg E: **0.294** / 0.10

Value of Lost Load (VoLL) context: ACER's 2023 estimate places average VoLL at €13.1/kWh for industrial customers and €3.2/kWh for residential. The SSI's R3 consequence multiplier allows us to identify which substations serve the most economically exposed territories. **4 substations** combine capital-intensive economic fabric ($R3 \geq 1.04$) with High or Critical risk classification — representing the highest VoLL-weighted exposure in the fleet.

The capital-intensive tier concentrates in **Vestland (310), Østfold (176), Trøndelag (147)** — regions where industrial corridors depend on uninterrupted power for continuous processes. A single hour of unplanned outage at these substations carries an estimated VoLL of €15–30/kWh, compared to €1–3/kWh in rural agricultural areas. The fleet-wide average energy poverty rate is 3.8%, but this masks sharp regional variation: Southern regions combine higher energy poverty with higher grid risk, creating a double vulnerability that the E component captures. This cross-referencing of economic fabric with grid condition is unique to the SSI — no competing framework links VoLL exposure to substation-level risk scores.

B.3 Fylke & Kommune Digital Readiness Ranking

Fylke ranked by average R7 modifier — lower values indicate weaker digital infrastructure (broadband penetration, smart meter coverage). Cross-referenced with average R_median to identify regions combining digital exposure with high grid stress.

WORST DIGITAL READINESS — TOP 15 REGION REGIONS

Longer bar = higher R7 = better digital infrastructure.

1	Finnmark ▲ high R	0.9623
2	Telemark ▲ high R	0.9625
3	Vestland	0.9634
4	Agder	0.9661
5	Trøndelag	0.9667
6	Møre og Romsdal ▲ high R	0.9667
7	Troms ▲ high R	0.9667
8	Innlandet ▲ high R	0.9668
9	Rogaland	0.9695
10	Vestfold	0.9703
11	Oslo	0.9704
12	Buskerud	0.9704
13	Nordland ▲ high R	0.9705
14	Viken	0.9716
15	Østfold	0.9716

region-level analysis reveals a clear digital divide mirroring the broader DESI pattern. **Finnmark** has the lowest average R7 (0.9623), while **Østfold** leads at 0.9716 — a spread of 0.0093 across the R7 range. **2 region regions** combine below-median digital readiness with above-median grid risk, making them priority targets for digitalisation investment. The R7 modifier is intentionally narrow to reflect the current limitations of open DESI data — as NIS2 compliance reporting matures, future editions will expand R7's dynamic range and incorporate operational technology (OT) security indicators.

B.4 Monthly Pulse

Inaugural edition — Baseline Snapshot (June 2026). This edition establishes the baseline for the Cyber & Economic Exposure Monitor. Key reference points: fleet average R7 = 0.9668, median = 0.9661; 0 substations classified HIGH cyber-exposure; 4 blind-spot substations (High/Critical risk + below-median R7); 0 Critical-band substations with below-median digital readiness. Future editions will track deltas against this baseline.

SECTION C

Data Refresh & Changelog

The SSI v4.0.2 draws on **30 verified public data sources** feeding 95 variables across 6 components and 7 modifiers. This section provides a live registry of all sources, their update frequencies, and the current state of the fleet. Transparency in data vintage is central to the SSI's credibility.

C.1 Update Frequency Timeline

C.2 Fleet Score Snapshot

substations scored

P5=0.238 · P95=0.400

0.1% of fleet

HIGH CONFIDENCE

100%

6495 subs · CI/R < 0.50

No primary data sources have been updated since the v4.0.2 launch baseline. All **6,495 substation scores remain unchanged** this edition. The fleet median R of 0.305 (mean 0.310) reflects a distribution skewed toward the lower bands, with 9.4% in Low and 90.5% in Medium. The first material score changes are expected when the national regulator publishes the annual quality-of-supply indicators and when DER registries refresh. High-frequency sources (OSM, weather) update weekly but feed only infrastructure topology (R4) and thermal proxy (I5), which have minimal impact on fleet-level score distribution.

C.3 Changelog — v3.4 → v4.0.2

15 changes tracked across PO, P1, and P2 releases

N01	NEW	Norway country launch — 6,495 substations across 15 Fylker, administrative kommune level
N02	DATA	Integrated Statnett SF transmission dispatch data + NVE reliability benchmarks
N03	DATA	NVE reliability register integrated — SAIDI/SAIFI standardisation for all DSOs (Elvia, BKK, Glitre Nett, Lede, Tensio, Agder Energi Nett)
N04	DATA	MET Norway winter storm + Arctic hazard data integrated — critical for boreal/Arctic climate exposure assessment
N05	DATA	DSB avalanche hazard mapping integrated — mountain corridor vulnerability in eastern/western valleys
N06	DATA	NGU rime ice loading mapping integrated — overhead transmission line vulnerability in high-altitude regions
N07	DATA	MET Norway + DSB + NGU climate integration — winter storm risk, snow accumulation, avalanche probability, rime ice hazard
N08	DATA	SSB Census 2021 + Eurostat socio-economic data integrated — vulnerability indices per kommune, Arctic remoteness
N09	DATA	Norwegian Wind Energy + NVE data integrated — RE penetration for coastal regions, wind capacity growth trajectory
N010	NEW	Norges Bank + NordPool hydropower cycle coupling integrated — E1 volatility modulation for reservoir-dependent regions

N011	ENHANCED	R6b modifier enhanced with triple MET+DSB+NGU hazard overlay: winter storm + avalanche + rime ice (range 1.00–1.25)
N012	ENHANCED	R3 consequence enriched with Arctic remoteness, population sparsity, Finnmark/Troms isolation + fjord enclosure metrics
N013	ENHANCED	R4 graph criticality rebuilt with Statnett 420kV topology + DSO network constraints + mountain pass bottleneck penalty
N014	NEW	I9 Hydropower Concentration Risk — new metric from NVE/Statkraft for major reservoir proximity (~90% of Norwegian generation)
N015	ENHANCED	R2 Adaptive IRI now includes CMIP6 SSP2–4.5 forward projections for Arctic winter extremes, avalanche probability shifts, permafrost change

SECTION D

The Oslo–Bergen Grid Corridor: Where Nuclear Concentration and Winter Storm Resilience Challenge Grid Stability

Deep–dive rotation: Each edition features a substantive thematic analysis. The 12–month rotation: **Ed. 001** Oslo–Bergen hydropower dominance and winter storm resilience corridor · **002** Eastern Norway DER & EU funding mismatch · **003** Arctic rime ice and avalanche infrastructure stress · **004** Metropolitan–Rural energy poverty disparity · **005** Grid stranding risk (hydropower–dependent assets) · **006** DSO smart meter rollout vs grid stress · **007** Gulf of Norway coastal flooding resilience · **008** T–component forward projections · **009** Fylke Grid Health Cards · **010** Academic validation and peer feedback · **011** European replication feasibility · **012** Year in review.

D.1 Why the Oslo–Bergen Corridor, Why Now

The Finnmark hosts **495 substations** across 1 region regions, making it the locus of this edition's deep–dive analysis. Its risk profile is concentrated in the upper bands: **3 substations (0.6%)** are classified High, with only **0** in the Low band. 93% of corridor substations score above the national fleet median of 0.305. The corridor median R of 0.369 reflects the local risk profile. The corridor concentrates the country's industrial heartland. The SSI flags continuity–of–supply deficits, infrastructure age mismatches with modern demand patterns, and grid modernization lag under national digitalisation timelines.

D.2 Corridor Map and Scoring

SUBSTATION	DISTRICT	R_FINAL	BAND	C	V	I	E	S	T	ALERT

... 485 additional substations — [explore full corridor in Digital Twin →](#)

D.3 Component Analysis

The dominant risk driver across the Finnmark corridor is **T (Transition)**, averaging 0.249 against a fleet average of 0.309 — occupying 499% of its weight ceiling (w = 0.05). The second contributor is **V (Voltage)** at 0.396 vs fleet 0.326 (396% of ceiling). Among modifiers, the R3 consequence multiplier averages 1.000 (fleet: 0.999), reflecting the socio-economic exposure of the corridor. The R6b seismic modifier averages 1.028, capturing the local seismic exposure — a dimension invisible to every competing framework.

D.4 Fylke Risk Profile

The region regions-level breakdown reveals significant intra-regional variation. **Finnmark** leads with a mean R of 0.373 across 495 substations, while **Finnmark** scores 0.373 — a spread of 0.000 within a single corridor. The SSI's substation-level granularity reveals that the Finnmark is not uniformly stressed but contains distinct sub-corridors of concentrated risk — precisely the kind of spatial pattern that investment planning requires.

D.5 Implications for Norway's Energy Transition

O Finnmark substations score $R \geq 0.650$, placing them in the upper quartile of national risk. For NEPN / national digital plan / RRP investment prioritisation, this analysis identifies the Finnmark sub-corridor as the highest-priority target — where DER deployment is accelerating against ageing infrastructure with above-average continuity deficits and significant socio-economic exposure. The SSI's silo-breaking approach reveals what no single-discipline framework can: that these substations matter not only because of their engineering condition, but because the communities they serve are disproportionately vulnerable to disruption. This is precisely the anticipatory grid planning capability that the SSI was built to provide.

European Context Card

How this works: Each edition includes one European Context Card drawn from the §16 Peer Benchmarking framework. The card is selected to complement the month's deep-dive theme. This month: **SAIDI comparison** — because Norway's hydropower dominance and winter storm resilience and grid resilience depend on understanding European performance standards. Future editions rotate through: VoLL comparison (Ed. 002), DER saturation vs Central Europe peers (003), CMIP6 climate hazard vs Nordic models (004), etc. The underlying data updates annually with NVE/RME and national regulator publications.

EUROPEAN CONTEXT CARD — SYSTEM AVERAGE INTERRUPTION DURATION INDEX Ed. 001 · April 2026

Unplanned SAIDI (min/customer/year) — Selected European Countries

Longer bar = lower SAIDI = better reliability. Values in min/customer/year.

Source: CEER Benchmarking Report on Quality of Electricity Supply (2024); ENVE/RMELECTRIC SAIDI reports; national regulator publications. Norway sub-categories from NVE/RME urban/rural classifications. · See §16 Peer Benchmarking for full methodology and caveats. · Updated annually.

This month's key insight: The Finnmark corridor deep-dive shows **495 substations** (of 495) with C-component above 70% of its weight ceiling — indicating continuity-of-supply performance consistent with rural territory classification. The corridor's average C of 0.470 is **1.2× the fleet average** of 0.394. The SSI reveals what aggregate national statistics conceal: that the country's mid-tier European position is not a uniform condition but a statistical average of urban-quality performance and rural-tier performance — and the corridor concentrates the worst of the latter.

Fylke Risk Ranking — All 15 Norwegian Fylker

Where does the Oslo–Bergen corridor sit within the national landscape? Fylke sorted by mean R_median, with band distribution and fleet comparison.

Longer bar = lower R = better resilience. Sorted worst → best.

The Finnmark ranks **#1 of 15 region regions** by mean R_{median} , placing it among the upper tier of national risk. The three most stressed are Finnmark, Nordland, Troms, while the three most resilient are Oslo, Rogaland, Vestfold. 6 of 15 score above the fleet average of 0.310. This ranking — possible only because the SSI scores every substation individually rather than relying on aggregate DSO or national statistics — reveals the true spatial distribution of grid stress. It is precisely this substation-level granularity that positions the SSI as a tool for investment prioritisation: not treating entire regions as monoliths, but identifying the specific corridors within each that demand attention.

SECTION F — RECURRING MODULE

SSI Enhanced Neural Network — Monthly Topic

From grid intelligence to renewable energy investment valuation. The SSI Index answers *"How healthy is this substation?"* The SSI Enhanced Neural Network (SSI-ENN) extends this into: *"What is a battery energy storage or renewable retrofit worth at this substation — to the DSO/Statnett SF and to the community?"* Each edition of this report explores one building block of the SSI-ENN's five-layer architecture, showing how the SSI Index data feeds directly into investment-grade grid analytics.

Explainability & SHAP Values

Clients need to understand not just the prediction but WHY a substation ranks highly

Investment-grade models require interpretability. SHAP (SHapley Additive exPlanations) provides a rigorous, game-theoretic attribution of each feature's contribution to each prediction. For every substation, the SSI-ENN produces a SHAP waterfall: starting from the fleet-average valuation and showing how each feature pushes the estimate up or down. This directly connects to the SSI Index: if SHAP identifies C (Continuity) as the dominant positive driver, the client knows the BESS value depends primarily on the substation's poor reliability history. Transparency converts model outputs into investment decisions.

KEY CONCEPTS

- SHAP: game-theoretic feature attribution per prediction
- Waterfall: fleet average → substation prediction
- Direct traceability to SSI components and data sources
- Feature importance validated against domain expertise

LIVE SSI DATA CONNECTION

The training set comprises 6,495 substations with complete feature vectors. Average CI_width of 0.053 across the fleet provides the uncertainty ground truth that the neural network's quantile regression heads must calibrate against. The fleet's risk distribution — 613 Low, 5877 Medium, 5 High, 0 Critical — ensures balanced training across all risk bands.

Coming next month: **LAYER 3** Uncertainty Quantification — *Investment-grade predictions require calibrated confidence intervals, not just point estimates*

SECTION G

Looking Ahead

NEXT MONTH — EDITION 02

Mountain Region

Deep-dive into Region 10's grid risk profile — substation map, component analysis, region regions breakdown. European Context Card: Light-rural tier — limited substation density.

NEXT DATA REFRESH

Q3 2026 — 5 Quarterly Sources

NVE Reliability Reports, SSB Demographics, Norges Bank Economics, Enova Programs, AMAP Arctic Assessment are due for refresh in Q3. Impact: DER registry (T1), business fabric indicators (E2), macro-economic data. Highest-impact annual source pending: **SSB (Statistisk sentralbyrå)** (10 variables → C1–C4, safety compliance, demographics, income distribution, population served, regional data).

FLEET SPOTLIGHT

Finnmark: Highest Risk Concentration

Finnmark has the highest concentration of High/Critical substations: **3 of 495 (1%)** are in the upper risk bands — avg R = 0.373. This makes it the most acute risk corridor in the fleet.

Edition 02 will be published on the second Thursday of July 2026. Deep-dive region: **Region 10**. To ensure you receive it, confirm your subscription segment (General / Institutional / Academic) by email to ssi_index@ikenga.eu.
