# 1 Climate Physical Risk Assessment

ESRS E1 · TCFD Physical Risk · EU Taxonomy Annex A

READY

## WHY THIS REPORT EXISTS

ESRS E1 (Climate Change) is material for 98% of CSRD-reporting companies. TCFD physical risk disclosure is mandatory in 36+ jurisdictions. The EU Taxonomy requires climate change adaptation activities to demonstrate that physical climate risks have been identified and addressed. This report quantifies acute and chronic climate hazard exposure at substation level using ERA5 reanalysis and Markov degradation modelling. For Poland, flooding in the Vistula and Oder basins, alongside coal mining subsidence risks, are critical climate hazards affecting grid resilience.

## SDG Alignment

### SDG 13 — Climate Action (primary)

Target 13.1 calls for strengthening resilience and adaptive capacity to climate-related hazards. The SSI IRI metrics (snow/ice, wind, heat stress) and Markov degradation model directly quantify how climate hazards affect this substation's operational resilience over 10- and 20-year horizons. With a Markov risk score of 0.477 and ETTC of 18.76 years, this substation's climate trajectory can be assessed against TCFD physical risk and EU Taxonomy adaptation screening requirements.

#### TECHNICAL VALIDITY

IRI metrics are computed from ERA5 reanalysis (31 km, hourly, 1940–present) using IEEE C57.91 thermal loading curves. Markov 5–state degradation is calibrated from CIGRE Technical Brochure 761 (2019) condition assessment data. Poland-specific flooding hazard derived from IMGW-PIB hydrological monitoring. Mining subsidence risk integrated from Central Mining Archive data. All inputs are production-grade with institutional provenance.

## 2 Grid Equity & Social Vulnerability

ESRS S1/S2 · SFDR PAI Social Indicators · UN PRI

READY

#### WHY THIS REPORT EXISTS

ESRS S2 requires companies to disclose impacts on affected communities. SFDR mandates 5 social PAI indicators. The SSI Index is uniquely positioned here because no competing grid risk framework integrates socio-economic vulnerability at substation resolution. This report surfaces where infrastructure risk concentrates in economically disadvantaged populations. In Poland, this is critical for coal-dependent regions undergoing just transition, energy-poor rural areas, and communities affected by mining closure.

SDG Alignment

SDG 7 — Affordable and Clean Energy (primary)

Target 7.1 requires universal access to affordable, reliable energy. This substation serves a catchment with V\_socio of 0.27 and energy poverty rate of 6%. The R3 social modifier (1.069) amplifies risk scores in coal-mining communities, rural areas with high unemployment, elderly concentration, and net outward migration — making spatial inequality visible and quantifiable at asset level.

SDG 7

SDG 10

SDG 1

Substation Profile

|                                |           |
|--------------------------------|-----------|
| V_socio (energy poverty index) | 0.27      |

|----------------------------------------------------------------------|--------------|
| Population & Economics<br>GUS (Central Statistical Office of Poland) | 2023 Annual  |
| Energy Market Data<br>URE (Energy Regulatory Authority of Poland)    | 2023 Annual  |
| Grid Operations Data<br>PSE (Polish Transmission System Operator)    | 2024 Monthly |

#### TECHNICAL VALIDITY

V\_socio is computed from the LIHC (Low Income High Cost) energy poverty definition using GUS (Polish Central Statistical Office) household expenditure data. The R3 modifier amplifies infrastructure risk scores in catchments with high unemployment, coal-mining exposure, elderly concentration, and net outward migration. Coal-mining percentage sourced from Central Mining Archive and regional employment registries. PARTIAL status reflects missing detailed elderly vulnerability enrichments — available from GUS at gmina level.

## 3 EU Taxonomy Alignment

Climate Delegated Act · Article 11 Climate Adaptation · Technical Screening Criteria

READY

#### WHY THIS REPORT EXISTS

The EU Taxonomy defines technical screening criteria for climate change adaptation in infrastructure. This is a critical ESG product for the SSI Index. The SSI composite score (R\_median), 6 components, modifier architecture, and Markov risk outputs provide the quantitative evidence base for Article 11 screening at asset

level. Poland, with its energy transition pathway from coal to renewables, requires robust taxonomy alignment to secure sustainable finance access.

SDG Alignment

SDG 9 — Industry, Innovation, Infrastructure (primary)

Target 9.4 calls for upgrading infrastructure to make it sustainable. The EU Taxonomy is the regulatory instrument that translates SDG 9 into investable criteria. By classifying this substation against Article 11 technical screening criteria — using R\_median (0.493), all 6 components, and 5 modifiers — this report provides asset-level Taxonomy alignment that enables sustainable finance reporting for Poland's grid modernisation.

SDG 9

SDG 13

TECHNICAL VALIDITY

Article 11 screening uses the full SSI v4.0.2 scoring engine: 6-component weighted composite (C=0.30, V=0.10, I=0.25, E=0.10, S=0.20, T=0.05), Gaussian copula Monte Carlo (10,000 iterations), and 5 modifiers (R3 social, R4 topology, R5 asymmetric CI, R6 restoration, R7 cyber). The Markov 5-state degradation model provides the forward-looking element. Poland-specific hazard data (flooding, subsidence) integrated from IMGW-PIB and Central Mining Archive. All inputs are from institutional open-source data with citable vintage — meeting CSRD Article 29a limited assurance requirements.

**WHY THIS REPORT EXISTS**

The energy transition creates infrastructure stress — bidirectional power flows, EV charging load, and intermittent renewable output strain substations designed for unidirectional delivery. This report measures whether grid infrastructure is keeping pace with decarbonisation. For Poland, transitioning from coal (52% of 2023 generation) to wind (28%) and solar (10%) represents dramatic volatility and requires grid modernisation at scale.

**SDG Alignment****SDG 7 — Affordable and Clean Energy** (primary)

Target 7.2 requires substantially increasing the share of renewable energy. This substation has a DER ratio of 0.171. The T1\_score (0.274) measures the stress this places on the substation. Poland's coal-to-renewables shift is unparalleled in Europe, making this feedback loop essential for policy makers.

SDG 7

SDG 13

SDG 9

Data Sources & Vintage

|                                                                                      |              |
|--------------------------------------------------------------------------------------|--------------|
| Energy Market Data<br>URE (Energy Regulatory Authority of Poland)                    | 2023 Annual  |
| Grid Operations Data<br>PSE (Polish Transmission System Operator)                    | 2024 Monthly |
| Renewable Installations<br>CIRE (Central Database of Renewable Energy Installations) | 2024 Monthly |

TECHNICAL VALIDITY

T1\_score is the weighted composite of DER\_ratio (renewable generation vs. local demand), DER\_variability (intermittency), and EV\_load\_ratio (electric vehicle charging load as fraction of capacity). DER data sourced from URE (Polish Energy Regulatory Authority) and renewable installation registries. Renewable generation percentage from PSE (Polish Transmission System Operator) 2025 data. DER\_ratio > 1.0 indicates net export during peak generation — a marker of successful energy transition with associated infrastructure stress.

5

## Pollution & Corrosion

ESRS E2 Pollution · ISO 9223 Corrosion Classification · Environmental Impact

READY

WHY THIS REPORT EXISTS

Transformer oil degradation, SF6 leakage, and corrosion-driven failures release pollutants affecting local environments. ESRS E2 requires disclosure of pollution risks. This report assesses the substation's corrosion classification under ISO 9223 and the environmental sensitivity of its surroundings. In Poland, air quality impacts from historical coal combustion make PM2.5 and SO2 exposure critical environmental metrics.

SDG Alignment

SDG 11 — Sustainable Cities and Communities (primary)

Target 11.6 aims to reduce the adverse environmental impact of cities. The corrosion class (C3) and E2\_local enrichment factor (1.53) track environmental degradation and pollution sensitivity at asset level. Where corrosion is advanced and maintenance deferred, equipment failure risks releasing mineral oil, PCBs (legacy units), and SF6. Poland's PM2.5 air quality challenges amplify these risks in urban and peri-urban regions.

SDG 11

SDG 3

SDG 15

Substation Profile

## Data Sources & Vintage

### Air Quality Monitoring

GIOŚ (Chief Inspectorate of Environmental Protection)

2023 Annual

### ISO 9223 Corrosion

ISO

2012 N/A

## TECHNICAL VALIDITY

Corrosion class follows ISO 9223:2012 atmospheric corrosion classification (C1–CX). Status depends on whether the corrosion class shows real variance across the fleet or uses default values. Full validation requires Polish environmental agency (GIOŚ) air quality monitoring overlay at substation coordinates (SO<sub>2</sub>, NO<sub>x</sub>, PM<sub>2.5</sub> deposition). Poland-specific data sourced from GIOŚ Central Database of air quality observations.

## 6 Cybersecurity Exposure

NIS2 Directive · ENISA Cybersecurity Index · ESRS G1 Governance

PARTIAL

### WHY THIS REPORT EXISTS

The NIS2 Directive mandates cybersecurity risk management for energy operators. A grid that is physically resilient but cyber-vulnerable is not truly resilient. The SSI R7 modifier combines SCADA assessment, communication architecture analysis, and national-level cyber maturity (ENISA/DESI indices) to produce a substation-level digital vulnerability score. Poland's role as a critical EU energy infrastructure hub makes cyber resilience a strategic imperative.

## SDG Alignment

### SDG 9 — Industry, Innovation, Infrastructure (primary)

Target 9.1 calls for resilient infrastructure — in digitalised grid systems, this must include cyber resilience. The R7 modifier (1.011) assesses digital vulnerability combining SCADA exposure, communication protocol security, and Polish national cyber maturity. SDG 16 (Strong Institutions) also applies: NIS2 compliance is a governance imperative for energy operators, and the betweenness centrality (O.049) identifies single-point-of-failure risk in the grid topology.

SDG 9

SDG 16

### Substation Profile

|                            |                         |

| Degree Graph degree                 | 2        | Grid resilience: Connectivity        | READY  |
| NIS2 Critical infrastructure status | Critical | NIS2 Directive: Operator designation | READY  |

### Data Sources & Vintage

|                                                          |               |
|----------------------------------------------------------|---------------|
| Cybersecurity Index<br>ENISA                             | 2024 Biennial |
| DESI Connectivity<br>European Commission                 | 2024 Annual   |
| NIS2 Criticality<br>Polish Cyber Security Center (CSIRT) | 2024 Annual   |

#### TECHNICAL VALIDITY

R7\_cyber is computed from a weighted combination of: (1) national cyber maturity via ENISA Cybersecurity Index and EU DESI connectivity indicators, (2) graph topology vulnerability (betweenness centrality = single-point-of-failure risk), and (3) SCADA protocol exposure assessment. NIS2 criticality designations sourced

from URE and Polish Cyber Security Center (CSIRT). Substation-level SCADA data is operator-proprietary — the national-level proxy provides a baseline but not asset-specific granularity.

# Audit Trail & Methodology Note

Traceability for CSRD Article 29a limited assurance

| ITEM                 | VALUE                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------|
| Scoring Engine       | SSI Index v4.0.2 — Gaussian copula Monte Carlo (10,000 iterations)                            |
| Weight Architecture  | C=0.30, V=0.10, I=0.25, E=0.10, S=0.20, T=0.05                                                |
| Modifiers Applied    | R3 C_mult: 1.069, R4 F_topo: 1.047, R6 restoration: 0.974, R7 cyber: 1.011, R6 seismic: 1.083 |
| Degradation Model    | Markov 5-state, CIGRE TB 761 calibration                                                      |
| Thermal Model        | IEEE C57.91 transformer loading curves                                                        |
| Report Date          | 13 May 2026                                                                                   |
| Reporting Period     | Calendar year 2025                                                                            |
| Refresh Cadence      | Annual (data ingestion → scoring engine → display)                                            |
| Substation           | Stacja elektroenergetyczna 110/20kV „GPZ Ziębice” (PL_226718784)                              |
| Data Assurance Level | All inputs from institutional open-source with citable vintage                                |
