

Today, Calabria loses power and the lights go out.

Tomorrow, it loses water, and the pumps fall silent.

By 2028, it loses compute, and the community goes dark in every sense of the word.

The SSI Index is the first open, auditable measure of infrastructure vulnerability at the substation level — fusing climate, seismic, infrastructure, economic, vulnerability, energy-transition and, from v4.6, a new Human dimension into a single score. Ten community metrics measured at substation catchment: life-support load, cold-chain clinical nodes, energy-poverty severity, digital-state exposure, food-system fragility and more. We cover 23 OECD countries today and are expanding to all 38 by the end of 2026.

We would like to offer your newsroom a free, unique monthly or quarterly country-spotlight report — co-branded Ikenga.eu + SSI.Index, Creative Commons BY-SA 4.0, ready to publish.

WHAT YOUR EDITORS RECEIVE

A unique country spotlight, published on your schedule

1–2 hero charts and a ranked data table from the live SSI pipeline

An editor-ready analytical narrative (400–1,200 words, tailored to your readers)

Machine-readable CSV/JSON under CC BY-SA 4.0

Full methodology and peer-reviewed references — auditable end-to-end

WHAT WE ASK

A byline that reads “Ikenga / SSI Index” alongside your own

A link to ikengassiindex.github.io so readers can explore the underlying data

Right of first publication for the cadence agreed (monthly or quarterly)

No payment, no paywall, no embargo game. We are a non-profit.

Italy is our proven baseline: 4,293 substations, 95 variables, 42.9 million Monte Carlo simulations, 89% alignment with utilities’ own post-hoc prioritisation. Every substation score resolves to a catchment — people, schools, dialysis centres, cold-chain businesses — not just an asset ID. Two attached samples show how a monthly (online) and a quarterly (national-paper) piece would read for pv magazine Italia and Il Sole 24 Ore.
